Self Reflection

My current understanding of generative AI is that they are ultimately high-complexity prediction models. The models generally use probability, statistics and linear algebra. The models are trained to identify relationships between the data and adjust their parameters to reach desired outputs. As gen AI evolves, they are able to produce a larger variety of different outputs of increasing overall quality and detail, giving them usage potential across multiple steps of creative processes. In writing, they can help summarize or organize information and ideas, write drafts, etc. Different models can also generate music, sound, video, images and other media, meaning they can help with the generation of placeholders or assets or variations that may otherwise be difficult or time-consuming for the user to make. There are ethical concerns about originality, copyright, attribution, and bias due to the datasets built through aggressive internet scraping and data used, which influences the output. I was inspired by *Unsupervised*, a 2022 work from Refik Anadol which was exhibited at New York's MoMA. It was interesting because it shows a way of using AI models themselves in artistic ways. The data it uses and the images it forms also raise interesting questions about the aforementioned ethical concerns.
